

Display Board Function

The DisplayBoard function is responsible for visualizing the current state of the board to the user. Key features include:

- Checks if the board is empty before attempting to display
- Presents a formatted view of all lists and their items
- Each list name is shown with its items indented underneath
- Clear section headers to separate the board from other program output

Edit Functions

The program provides comprehensive editing capabilities through several specialized functions:

List Editing (`edit_list`)

The `edit_list` function allows users to modify the contents of a specific list:

- Validates that the requested list exists before proceeding
- Provides a sub-menu with multiple editing options
- Supports adding, editing, and deleting items within a list
- Returns to the main menu when editing is complete

Board Editing (`edit_board`)

The `edit_board` function lets users modify the structure of the board itself:

- Supports three operations:
 1. Renaming an existing list
 2. Adding a new list to the board
 3. Deleting a list (including all its items)
- Validates list existence before attempting modifications
- Clears input buffer to prevent issues with input methods

Supporting Functions

Several helper functions enable the edit operations:

- `editItem`: Updates an item's name within a specified list
- `deleteItem`: Removes an item from a list with proper memory management
- `addItem`: Adds a new item to a specified list
- `editListName`: Changes the name of an existing list
- `deleteList`: Removes a list and all its contents with proper memory cleanup
- `addList`: Creates a new empty list

Memory Management

All edit functions properly manage memory by:

- Allocating memory for new lists and items
- Freeing memory when items or lists are deleted
- Maintaining proper linked list connections when structures change

Implementation Notes

- List and item names are stored with a maximum length limit
- The program handles user input validation to prevent errors
- Format functions ensure consistent display of list names with colons
- Error messages provide feedback when operations cannot be completed
